

All JavaScript String Functions:

```
let str = " Hello World! ";
```

Character methods:

charAt: Gets the character at a given position.

charCodeAt: Gets UTF-16 code of the character at a given position.

codePointAt: Gets full Unicode code point of a character.

```
str.charAt(1);           // "H"  
str.charCodeAt(1);       // 72  
str.codePointAt(1);      // 72
```

Concatenation

concat: Joins two or more strings.

```
str.concat(" JS");       // " Hello World!  JS"
```

Ends/Starts

endsWith: Checks if string ends with given text.

startsWith: Checks if string starts with given text.

```
str.endsWith("! ");      // true  
str.startsWith(" H");    // true
```

Includes / Index

includes: Checks if string contains given text.

indexOf: Finds first position of given text.

lastIndexOf: Finds last position of given text.

```
str.includes("World");    // true  
str.indexOf("o");         // 5  
str.lastIndexOf("o");     // 7
```

Compare

localeCompare: Compares two strings based on locale rules.

```
str.localeCompare(" Hello World! "); // 0
```

Match

match: Returns matches of regex.

matchAll: Returns all matches of regex with details.

```
str.match(/World/); // ["World"]  
[...str.matchAll(/o/g)] // [["o"], ["o"]]
```

Normalize

normalize: Returns Unicode-normalized version of string.

```
// Normalize  
str.normalize(); // " Hello World! " (same, unless accents)
```

Pad

padEnd: Adds padding at the end until length is reached.

padStart: Adds padding at the start until length is reached.

```
// Pad  
str.padStart(20, "-"); // "----- Hello World! "  
str.padEnd(20, "-"); // " Hello World! -----"
```

Repeat

repeat: Repeats string given number of times.

```
// Repeat  
str.repeat(2); // " Hello World! Hello World! "
```

Replace

replace: Replaces first match of regex/text with new text.

replaceAll: Replaces all matches of regex/text with new text.

```
// Replace  
str.replace("World", "JS"); // " Hello JS! "
```

```
str.replaceAll("l", "_");    // " He__o Wor_d! "
```

Search

search: Finds position of first regex match.

```
// Search
str.search("World");    // 7
```

Slice / Substring / Split

slice: Extracts part of string (by indexes).

split: Splits string into array by separator.

substring: Extracts part of string (by indexes).

```
// Slice / Substring
str.slice(1, 6);        // "Hello"
str.substring(1, 6);    // "Hello"
str.split(" ");         // ["", "Hello", "World!", ""]
```

Case

toLocaleLowerCase: Converts string to lowercase (locale-aware).

toLocaleUpperCase: Converts string to uppercase (locale-aware).

toLowerCase: Converts string to lowercase.

toUpperCase: Converts string to uppercase.

```
// Case
str.toLowerCase();      // " hello world! "
str.toUpperCase();      // " HELLO WORLD! "
str.toLocaleLowerCase(); // " hello world! "
str.toLocaleUpperCase(); // " HELLO WORLD! "
```

Trim

trim: Removes spaces from both ends.

trimEnd / trimRight: Removes spaces at the end.

trimStart / trimLeft: Removes spaces at the start.

```
// Trim
str.trim();             // "Hello World!"
str.trimStart();        // "Hello World! "
str.trimEnd();          // " Hello World!"
```

Convert

valueOf: Returns the primitive value of string.

toString: Converts string object to primitive string.

```
// Convert  
str.toString();    // " Hello World! "  
str.valueOf();     // " Hello World! "
```
